

CPMS D10 Dividend/Earnings Growth

Benchmark
S&P 500 TR

Investment Objective

The CPMS US Double 10 Dividend and Earnings Growth Strategy is suited for investors seeking style diversification. The strategy can hold up to 20 stocks in its simulated portfolio with 10 stocks selected from the CPMS US Dividend Growth strategy and 10 stocks selected from the CPMS US Earnings Growth strategy. In the Dividend Growth strategy, there is a maximum of three stocks allowed in one industry group while in the Earnings Growth strategy, there is a maximum of two stocks allowed in any one industry group. The strategy diversifies between stocks with high expected dividend growth and stocks with high returns on equity.

Volatility Analysis

It is important to note how a model's performance fluctuates over time. More volatile investments are those that experience more exaggerated price increases or decreases. Generally speaking, investors with a shorter time horizon should avoid higher volatility investments. However, it is worth noting that some of the risk associated with highly volatile investments can be offset through proper portfolio construction.

Important Disclosures

When used as supplemental sales literature, the Strategy Profile must be preceded or accompanied by this disclosure statement.

Performance

A CPMS strategy is quantitatively driven and governed by pre-defined buy and sell rules for stock selection. Performance of CPMS strategy represents simulated performance. No actual trading is undertaken. Performance of the strategy is based on the total return of an initial portfolio of stocks that is equally-weighted and then rebalanced monthly.

The performance data given represents past performance and should not be considered indicative of future results. Principal value and investment return will fluctuate. Strategy statistics change over time.

Total return reflects performance without adjusting for the effects of taxation, but is adjusted to reflect trading costs and assumes reinvestment of dividends and capital gains.

The strategy's performance is compared with that of an index. The index is an unmanaged portfolio of specified securities and the index does not reflect any initial or ongoing expenses. A strategy's portfolio may differ significantly from the securities in the index.

Growth of \$10,000 Graph

The Growth of \$10,000 graph shows a strategy's performance based on how \$10,000 invested in the strategy would have grown over time. The returns used in the graph are not load-adjusted. The growth of \$10,000 begins at the date of the strategy's inception, or the first year listed on the graph, whichever is appropriate. Located alongside the strategy's graph line is a line that represents the growth of \$10,000 in an index. The inclusion of the index allows investors to compare the performance of the strategy with the performance of a benchmark index.

Risk Measures

R-squared reflects the percentage of a strategy's movements that are explained by movements in its benchmark index, showing the degree of correlation between the strategy and the benchmark.

Beta is a measure of a strategy's sensitivity to market movements. A portfolio with a beta greater than 1 is more volatile than the market, and a portfolio with a beta less than 1 is less volatile than the market.

Alpha measures the difference between a strategy's actual returns and its expected performance, given its level of risk (as measured by beta).

Sharpe ratio uses standard deviation and excess return to determine reward per unit of risk.

Standard deviation is a statistical measure of the volatility of the strategy's returns.

Morningstar Style Box™

The Morningstar Style Box reveals the investment strategy. Typically, for equity funds and fixed income funds respectively, the vertical axis shows the market capitalization of the stocks owned or the average credit quality of the bonds owned. The horizontal axis shows investment style (value, blend, or growth) or interest rate sensitivity as measured by a bond's duration (short, intermediate or long). Duration is a measure of interest-rate sensitivity—the longer a fund's duration, the more sensitive the fund is to shifts in interest rates. The Morningstar Style Box depicts the investment style of the simulated equity portfolio as dictated by the underlying strategy.
